前馈计算

$$g_k(x) = z_k = f\left(\sum_{j=1}^{n_H} w_{kj} f\left(\sum_{i=1}^d w_{ji} x_i + w_{j0}\right) + w_{k0}\right)$$

反向传播

考虑隐藏层到输出层

$$\frac{\partial J}{\partial w_{kj}} = \frac{\partial J}{\partial net_k} \frac{\partial net_k}{\partial w_{kj}}$$

对于

$$J(w) = \frac{1}{2} \sum_{k=1}^n (t_k - z_k)^2$$

有

$$\begin{aligned} \frac{\partial J}{\partial net_k} &= \frac{\partial J}{\partial z_k} \frac{\partial z_k}{\partial net_k} = (z_k - t_k) f'(net_k) \\ \therefore \frac{\partial J}{\partial w_{kj}} &= (z_k - t_k) f'(net_k) y_j \end{aligned}$$

考虑输入层到隐藏层

$$\frac{\partial J}{\partial w_{ji}} = \frac{\partial J}{\partial y_j} \frac{\partial y_j}{\partial net_j} \frac{\partial net_j}{\partial w_{ji}}$$

其中

$$\begin{aligned} \frac{\partial J}{\partial y_j} &= \sum_{k=1}^c \frac{\partial J}{\partial z_k} \frac{\partial z_k}{\partial y_j} \\ &= \sum_{k=1}^c (z_k - t_k) \frac{\partial z_k}{\partial net_k} \frac{\partial net_k}{\partial y_j} \\ &= \sum_{k=1}^c (z_k - t_k) f'(net_k) w_{kj} \\ \therefore \frac{\partial J}{\partial w_{ji}} &= \sum_{k=1}^c (z_k - t_k) f'(net_k) w_{kj} \cdot f'(net_j) x_i \\ &= \sum_{k=1}^c \delta_k w_{kj} \cdot f'(net_j) x_i \\ &= \delta_j x_i \end{aligned}$$

贝叶斯理论

当采用均方差准则进行反向传播训练时，多层神经网络可产生一个相应于贝叶斯判别函数的最小二乘判别。
